

Mini Hackathon Practise Run

Please Note That this is not a official Hackerthon assignment document.

Practice Problem Topic: Campus Lost & Found Portal

Build a small web application where students can report items they've lost or found on campus, browse current reports, and get in touch about a match.

Key Requirements

- **Browse Reports** — Show all lost and found reports on one page, as a list or grid, pulled from sample data (at least 8–10 items). Each entry should clearly show whether it's a "Lost" or "Found" item, along with the item name, location, and date.
- **Item Details** — When someone clicks a report from the browse page, take them to a page with the full details: a description of the item and how to contact the person who posted it.
- **Report Form** — Let users submit a new report. The form should collect the item name, category, location, date, a description, contact info, and whether it was lost or found (a toggle or dropdown).
- **Form Validation** — Required fields can't be left blank, and the date can't be set in the future. Show at least one clear, visible error message when something's wrong — not a silent failure.
- **Search or Filter** — Let users narrow the browse page by status (Lost/Found), category, and/or a keyword search.
- **Mark as Resolved** — Give users a way to mark a report as claimed or returned, and make sure that's visibly reflected in the listing — a "Resolved" badge or a greyed-out card, for example.
- **Navigation** — A consistent nav bar or menu across every page, with a clear indicator of which page the user is currently on.
- **Responsive Layout** — The app should hold up both at full desktop width and in a narrow, phone-width browser window.
